

• LIVE & DEPLOYED

Lenta — 60-second reviewer quick-start

A working, deployed AI video-recommendation system. Operate it yourself — no setup.

DASHBOARD (LIVE UI)

The 5-click demo (≈ 1 minute)

On the dashboard, use the **Scenario Controls** panel:

- 1 **Start** the simulation (rate ≈ 10) — synthetic users flow through the real recommender; the dashboard comes alive.
- 2 Read the **A/B test** panel — the recommender (treatment) beats the “most-popular” baseline (control), most visibly on **watch-time**.
- 3 Click **genre_shift** (intensity 3–4) — a group of users suddenly prefers a new genre.
- 4 Click **Trigger retrain** — a new model trains and goes live in ~10 seconds.
- 5 Watch the **banner**, the **model timeline**, and the **sample user’s feed** all shift — the system just learned, live.

What you’re looking at — 5 live panels

1 • **Live workflow** — the funnel (catalog → candidates → ranked → feed), a live feed & event ticker.

2 • **Model timeline** — model quality across versions as it learns.

3 • **A/B test** — recommender vs popularity, with the lift.

4 • **Scenario controls** — the demo cockpit (used above).

5 • **Pipeline status** — the backend stages (ingest → feature update → retrain → deploy) running in real time.

Why it’s credible: the complete production-shape funnel (collaborative-filtering retrieval → watch-time ranking → diversity/freshness re-rank), real-time (Redis) + self-learning (retrain → registry → hot-swap) loops, proven with a built-in A/B test, running continuously with bounded resources. Full architecture, integration & scaling guides are in the presentation and the repo’s docs/.
